TWENTY YEARS OF OHIO AGRICULTURE 1910-1930

J. I. FALCONER

PREFACE

The period from 1910 to 1930 was one of marked change in Ohio agriculture. Outstanding was the wide fluctuation in prices. By 1916 the World War was leading to higher prices. With the entry of this country into the War in the spring of 1917, prices jumped and continued on a level twice that of 1910-1914 until 1920. The drastic fall in prices in the latter part of 1920 and in 1921 ushered in a new period of lower prices. This latter period was one of industrial prosperity but of relatively low income to agriculture, as expressed in the fact that farm land values continued to decline.

In spite of the foregoing, however, there was widespread improvement and changes in farming. Farming became more commercialized. An expanding industrial population and improved transportation facilities gave better markets and led to the expansion of those types of farming usually found near cities. The substitution of the automobile, the truck, and the tractor for the horse greatly increased the cash expenses of farm operations but enabled the enlargement of the volume of business. Improved methods of breeding, growing, feeding, harvesting, and marketing were widely adopted. Probably no period has seen a greater advance in the facilities for farm life than that from 1910 to 1929.

GROWTH OF POPULATION AND INDUSTRY

| | Total population | Farm population | Per cent farm population was of total |
|-----------|------------------|-----------------|--|
| 1910..... | 4,767,121 | 1,244,769 | 26.1 |
| 1920..... | 5,759,394 | 1,139,329 | 19.8 |
| 1930..... | 6,646,697 | 1,004,288 | 15.1 |

The two decades from 1910 to 1930 were marked in Ohio by a rapidly expanding industrial and urban population and, at the same time, by a decline in the farm population. The non-farm population of the State increased 64 per cent; whereas the farm population decreased 18 per cent. In 1930, only 15 per cent of the population of the State lived on farms, and 14.6 per cent of the males 10 years old or over, gainfully employed, were engaged in agriculture.

This rapidly expanding industrial and urban population brought to agriculture an enlarged local market, and with it came a shifting towards those types of farming which are usually found in the vicinity of good local markets. Another effect of the expanding urban population was to take a considerable acreage of farm land out of agricultural use. This latter movement was greatly aided by the development of the automobile and hard roads and, with them, the suburban movement.

In 1930 there were in the State 59 cities of over 10,000 population, 31 of over 20,000 population, and 12 of over 50,000 population. Although Cleveland, Cincinnati, Columbus, Toledo, and Akron (in widely scattered parts of the State) were the leading cities, the greatest concentration of industry was to be found in the northeastern part of the State. Here, eight counties contained over one-third of the total population of the State.

While this rapid increase in population for the State as a whole was going on, 40 counties, or nearly one-half the total number, showed a decrease in population from 1910 to 1930. These were the more rural counties. Several causes contributed to this rural population decrease. In the first place, the adoption of larger units of machinery made it possible for fewer men to farm the land. In Paulding County, a strictly rural county in the northwest, there was a 33 per cent decrease in population during the 20 years, due in part to the enlargement of farms. In Monroe County in the southeast, there was a decrease of 26 per cent in population, due largely to the abandonment of some of the poorer land. In Cuyahoga County the number of farms declined from 4,493 in 1910 to 1,229 in 1930, due to the expansion of the Cleveland Area. For the State as a whole there was a tendency for the size of the farm family to become smaller.

Fig. 2.—Percentage change in population from 1920 to 1930

TRANSPORTATION

The development of good roads, the automobile, and the truck were the outstanding transportation changes of this period. Just as new eras in Ohio transportation were opened up by the canals in 1825 and by the railroads from 1837 to 1850, highway improvement and motor transportation marked the period from 1910 to 1930. The State Department of Highways was created in 1904 but functioned at first only in an advisory capacity. In 1910 the duties of the State Department were changed from purely advisory to those of actual construction. The first piece of concrete road in the State Highway system was built in Harrison County in that year. A State Highway system known as the inter-county system was authorized in 1911. By the end of 1929 there were 11,139 miles of road in the State system, one-half of which had concrete, brick, asphalt, and bituminous macadam surfaces and only 205 miles of which remained as earth roads. The principle of state aid for roads was again introduced in 1905, and in 1909 motor vehicle license fees were first introduced as a source of highway revenue. The gasoline tax was adopted as a source of highway revenue in 1925, when a 2-cent-per-gallon tax was imposed. By 1930 this tax had been increased to 4 cents per gallon. By 1929 the counties had also improved 81 per cent of the county road system, mostly with traffic-bound macadam or gravel. Of the township roads 70 per cent remained as dirt roads. In 1929, of the 84,703 miles comprising the total road mileage of the State, 57 per cent was improved with gravel or better and 43 per cent remained as earth roads. By 1930 the Census reports that 26.5 per cent of Ohio farms was on dirt roads, 37.4 per cent on gravel roads, and 36.1 per cent on hard roads. Several western Ohio counties had less than 3 per cent of their farms on dirt roads; whereas in several of the southeastern counties over 60 per cent of the farms was still located on dirt roads. When it is remembered that probably a majority of those farms on dirt roads was not over 2 miles from an improved road, it is evident that great progress has been made.

Paralleling the development of improved roads has gone the general adoption of the automobile and truck for farm to market transportation. Few farmers owned automobiles in 1910 but, in 1930, 79 per cent of all farms reported automobiles and 14 per cent owned trucks. This latter figure does not adequately represent the importance of the truck to agriculture, since a large part of the hauling from farm to market is now done by commercial truckers. In 1910 the market milk coming into the larger cities was largely brought in by railroad or electric lines; in 1930 it was nearly all hauled in by truck. The result of this change in transportation facilities has been to bring the farm relatively closer to market and to enlarge the area which might be classed as nearby territory. It has also greatly widened the farmer's choice of a market since he is no longer limited to the local shipping point for an outlet for his livestock or to the nearby city for an outlet for the fruit and vegetables.

Improvement in transportation facilities also resulted in marked changes in the farm social life. A trip to town was now a matter of little moment. A trip to the city 25 or 50 miles away could now be made at the farmer's convenience. The country store, the country church, and other local institutions or organizations often lost to the larger institutions in the larger centers. Thus, much of the isolation which was formerly a characteristic of farm life had disappeared.

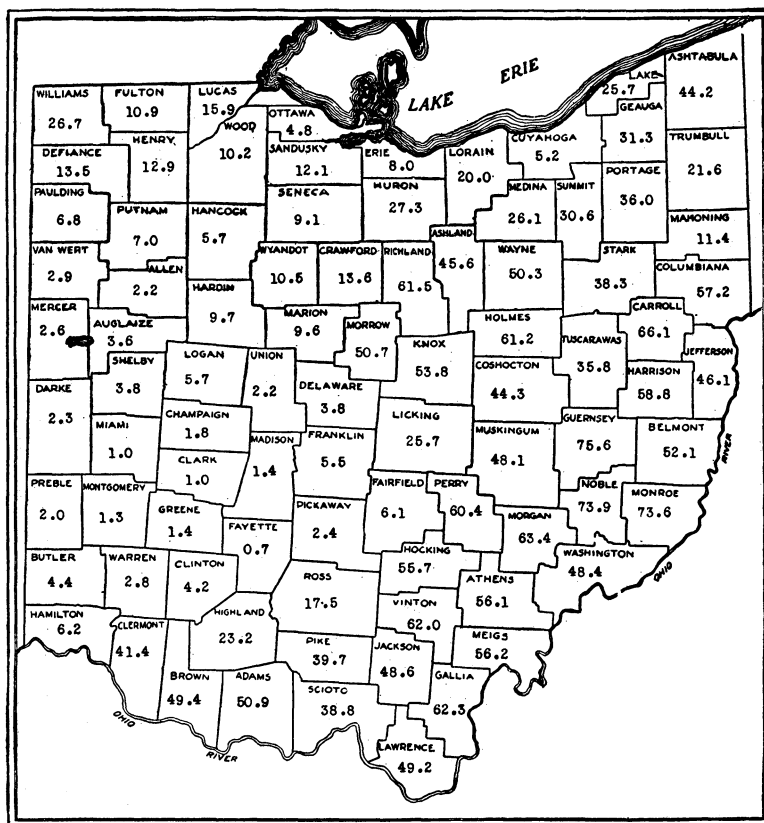

Fig. 3.—Percentage of farms located on dirt roads, 1930

FARM MACHINERY

The use of larger units of machinery and the general adoption of the gas engine for farm use were the outstanding developments in farm machinery during the years 1910 to 1930.

The importance of the automobile and the truck as a means of transportation has already been discussed. The tractor as a machine for farm use, other than stationary power for threshing and baling, largely came into use in the State during this period. In 1930, 23 per cent of all farms in the State reported tractors, and the number of farms having tractors was equal to 57 per cent of the number of all farms over 100 acres in size. In the western half of the State the percentage having tractors was much larger. In addition to the tractor for field work and belt work, the smaller gas engine was widely adopted for such purposes as pumping water. It was largely the gas engine which caused the 45 per cent decrease in horses on Ohio farms from 1910 to 1930. Not only did the use of the tractor cause the use of larger units of machinery, but also the practice of using more horses in the team grew. Three and four horses made up the prevailing team for seedbed preparation in 1930. The corn binder, corn shredder, corn pickers, hay loaders, manure spreaders, milking machines, cream separators, and sheep shearing machines are all tools which were widely adopted during the period. The disc harrow, although not a new machine, was greatly improved. About 1925 the first combined harvester-thresher made its appearance in the State; by 1930 there were about 175 of these in use. The crop acreage which one man normally handled was probably increased from 25 to 50 per cent during the period due to these new and improved methods. A relatively high labor cost during the greater part of the period encouraged the use of more machinery.

Another significant development during the period was the making of electricity available to the farm, first through farm plants and during the last 10 years by the extension of power lines into rural territory. In 1930, nearly 57,000 farms in the State reported the home lighted by electricity, over 37,000 of these by electricity from power lines. In addition to household use, many farms were using the power for grinding, milking, cream separating, and other work about the farmstead.

PRICES AND INCOME

An outstanding feature of the period from 1910 to 1930 was the rise in prices from 1915 to 1920, as a result of the World War, and the drastic decline in prices in 1920 and again beginning at the close of 1929. Wheat fluctuated around one dollar per bushel from 1910 to 1915; in 1920 it reached \$2.50 per bushel and then fell to \$1.10 per bushel by the autumn of 1921; from the latter date to 1930 it ranged from \$1.00 to \$1.50 per bushel. Hogs were selling at around \$7.00 or \$8.00 per hundred from 1910 to 1915. In 1919 they reached \$20.00 per hundred and in 1921 were again selling for \$7.00. From 1925 to 1930 they averaged around \$10.00 per hundred. Wool, which sold for 22 cents per pound from 1910 to 1914, brought 65 cents in 1918 and 1919 and then fell to 21 cents in 1921. From 1923 to 1930 it ranged from 35 to 45 cents per pound but was again 22 cents in 1930. The above is typical of the course of farm prices during the period.

Expressed in terms of index numbers, with that of 1910 to 1914 as 100, Ohio farm products were selling at 106 in 1915; at 203, 218, 212, and 132 in 1918, 1919, 1920, and 1921, respectively. From 1926 to 1930 they fluctuated around 150 but were again rapidly falling in the latter year.

The period from 1915 to 1920 was one of marked prosperity for Ohio agriculture, but the period from 1921 to 1930 was one of lower prices and income. During the period of rising prices farm product prices rose more rapidly than did those of the commodities which farmers buy, but from 1920 to 1930 farm product prices fell faster and further than did those of the commodities which farmers buy. From 1921 to 1930, therefore, Ohio agriculture was faced with a relatively low income and declining property values. A situation which was aggravated somewhat by the fact that during the greater part of the period, at least from 1923 to 1930, the urban population was comparatively prosperous. From 1910 to 1914 the annual income to Ohio agriculture from the sale of products averaged around \$220,000,000, in 1919 it was over \$582,000,000, in 1921 it was \$296,000,000, and from 1923 to 1930 it averaged \$340,000,000. Income in the latter period was less than 70 per cent that of 1920 but expenses were nearly the same.

TABLE 1.—Average Annual Farm Price of Ohio Farm Products

| Year | Corn | Wheat | Oats | Hay | Hogs | Beef cattle | Wool | Poultry | Eggs | Farm butter | Butterfat | Index Ohio farm products price (1910-14=100) |
|-----------|------|-------|------|-------|-------|----------------|------|---------|------|----------------|-----------|--|
| 1910..... | 0.59 | 1.03 | .41 | 12.00 | 8.50 | 5.50 | .26 | .12 | .23 | .25 | | 104 |

AGRICULTURAL EDUCATION AND ORGANIZATION

The period was marked by the expansion of the facilities for agricultural education and for the diffusion of agricultural information. The Smith Levy Act, passed by Congress in 1914, made provision for the expansion of Agricultural Extension Work under the direction of the State Agricultural College. For some time previous to this, the Agricultural Experiment Station had been engaged in research relating to the problems of agriculture of the State and the College of Agriculture had been sending their students back to the farm, but now increased facilities were available for bringing to the farm the new findings of the Experiment Station and of other farmers.

The Smith-Hughes Act, passed by Congress in 1917, made provision for the teaching of agriculture in the high schools. By 1930 over 200 high schools in the State were employing an agricultural teacher under the Act. The farm press had greatly improved and enlarged its facilities for service during the 20 years. The radio had been added to the facilities available. However, more than all else the farmer, by more study, wider travel, and observation, was putting into practice the information which was made available.

Another development of the period was a renewed interest in organization and in marketing. Since 1910 the Ohio farmer has given more attention to his marketing problems. This largely took the direction of improvement in quality, better packing, and organization in marketing. The farmer organization movement of the 1870's had largely subsided by 1900. The Grange still remained strong in Ohio, but its marketing and purchasing activities of the Seventies had been largely eliminated. From 1917 on, a renewed interest in organization developed. The State Farm Bureau was organized in the following year. The organization of farmers' elevators in the State was well under way in 1912. The organization of cooperative livestock shipping associations began in 1916; in 1920 a State federation was formed. Cooperative milk marketing organizations rapidly sprang into existence. From 1920 to 1930 the growth of these marketing activities was substantial. Local organizations were affiliated into state and national organizations. Although the chief attention was given to selling, the practice of cooperative buying also expanded. In addition to their marketing activities, the farm organizations of 1929 occupied a strong position in the State as the spokesman for agriculture.

FARM LIFE

Probably no 20-year period has seen a greater improvement in the facilities for farm life than that from 1910 to 1930. In 1910 the State had only just embarked on a program of road building; by 1930 over 73 per cent of the farms of the State could be reached by a gravel road or better. In 1910 automobiles were a novelty; 20 years later 80 per cent of the farms in the State reported the ownership of an automobile. It is difficult to estimate now what these changes have meant to farm life; at least, it is true that it has virtually abolished what was once considered a chief characteristic—namely, isolation. Other developments in this respect have been the rural mail delivery and the telephone. Nearly one-half of the farm homes in the State reported a telephone in 1930.

School facilities had been much improved and, by virtue of better roads, made more accessible. The radio now to be found in nearly every farm home was seldom seen in 1920. In 1930 nearly 30 per cent of the farms in the State reported running water in the house, and 25 per cent reported the dwelling to be lighted by electricity; the latter was a development which had come about largely during the 20-year period.

It is not by chance that the old appellation "hayseed", which in earlier years was used by the city press to characterize farmers, is now seldom heard.

LAND IN FARMS AND VOLUME OF PRODUCTION

| | Land in farms (Acres) | | 11 crops (Acres) |
|-----------|--------------------------|-----------|---------------------|
| 1900..... | 24,501,985 | | |
| 1910..... | 24,105,708 | 1909..... | 11,266,000 |
| 1920..... | 23,515,888 | 1919..... | 11,974,000 |
| 1930..... | 21,514,059 | 1929..... | 9,616,000 |

The land area of Ohio is 26,073,000 acres; 90.5 per cent of this area was in farms in 1900 and in 1930, 82.5 per cent. The two principal reasons for this decrease were the expansion of the city and urban areas and the tendency for farms in some of the less productive areas of the State to be abandoned. Of the land not in farms in 1930, which comprised about 4,500,000 acres, probably one-third was taken up by cities and by urban activities and the other two-thirds was rural land lying outside the bounds of farms. Since 1900 the area of farm land in the six counties Cuyahoga, Hamilton, Lucas, Franklin, Summit, and Stark has decreased by over 545,000 acres; this decrease can largely be attributed to the expansion of the urban area. Since 1900 probably over 750,000 acres have passed from land in farms to urban use; whereas 2,000,000 have passed out of farms for other reasons.

The Census of 1930 reported 97.1 per cent of the land in Preble County as in farms, but only 18.6 per cent of the land in Cuyahoga County was so included. Other counties varied between these two extremes. Eastern Ohio had the largest area not in farms. In the northeastern counties much of this land was included in the urban area; in southeastern Ohio much of the land lay idle. In Vinton County, where there were no cities and where the largest village had a population of only 1,188, only 58.4 per cent of the land areas was included in farms in 1930. In this county the area of land in farms decreased by 78,000 acres from 1880 to 1930.

Approximately one-half of the land in farms was reported as in crops in 1929; whereas 37 per cent was in pasture. From 1910 to 1930 the area of land in farms in the State decreased by 10.7 per cent, and the area in the 11 leading crops decreased by 15 per cent.

This decline of land in farms did not, however, lead to a decrease in the volume of agricultural production in the State. When we compare the period 1910 to 1914 with that of 1925 to 1929, it appears that in the latter period the total volume of agricultural production in the State was 6 per cent greater and the volume of sales 10 per cent greater. The foregoing figures refer to actual physical volume and not to value. The explanation of this increase in volume of production lies in more intensive crops, better yields, and an increase in the livestock industry. The greater increase in the volume of sales than of production may be attributed to the growing commercialization of agriculture; the substitutions of the tractor, the truck, and the automobile allow a greater percentage of the total farm production to be sold.

Fig. 4.—Percentage of land area in farms, 1930

Fig. 5.—Percentage of all land in farms which was cropped, 1929

Fig. 6.—Pasture land—Percentage of all land in farms, 1929

Fig. 7.—Woodland—Percentage of all land in farms, 1929

FARM REAL ESTATE VALUES

AVERAGE VALUE OF FARM LAND AND IMPROVEMENTS

| | Dollars per acre |
|------------|------------------|
| 1900 | 42.28 |
| 1910 | 68.62 |
| 1920 | 113.18 |
| 1930 | 78.69 |

During this period farm land values rose and fell with the price of farm products. From 1910 to 1915 there was little change, but by 1920 farm land values were at least 65 per cent above those of 1910. From 1920 to 1930 land values again dropped and at the end of the period were near those of 1910.

Unfortunately for agriculture much land changed hands during the period of high prices. Many purchased farms and many others added land to that which they already had. A heavy mortgage was frequently given which led to difficulty in later years. By 1925 land values had declined to the point where many mortgages were being foreclosed. Low prices for farm products not only depreciated the value of land but made it hard to earn the interest payment. Foreclosures increased in number, until, by 1930, they had become a major problem of agriculture.

The data on land values for the State, as given above, are those for all lands in the State reported as in farms. The figures, however, are influenced by the expansion of city and suburban areas during the period. Cuyahoga County farm land, for instance, in 1910 was valued at \$205 per acre, in 1920 at \$298 per acre, and in 1930 at \$613 per acre. If the 11 urban counties of the State which reported land values of \$125 per acre or over in 1930 are omitted, the per-acre values as given below are arrived at and these are probably a better indication of farm land values during the period.

| | Land alone | Land and buildings |
|-----------|------------|--------------------|
| 1900..... | \$28.00 | \$ 35.50 |
| 1910..... | 45.50 | 59.20 |
| 1920..... | 81.40 | 106.75 |
| 1930..... | 41.70 | 69.46 |

It will be noted that land alone was lower in price in 1930 than in 1910. When land and buildings are both considered, however, the per-acre value was higher in 1930 than in 1910. This was due both to better buildings and to the fact that land values had fallen more rapidly than building costs. In 1910 buildings comprised 23 per cent of the total farm real estate value; in 1930 they comprised 39 per cent.

Fig. 9.—Value of land and buildings per acre—Dollars, 1920

NUMBER OF FARMS

| | |
|------------|---------|
| 1900 | 276,719 |
| 1910 | 272,045 |
| 1920 | 256,695 |
| 1930 | 219,296 |

Up to 1900 the number of farms in Ohio increased; since that date the number has grown less. During the 20 years the number of farms in the State decreased 19 per cent. Farms under 50 acres in size, however, decreased 34 per cent; whereas farms from 175 to 500 acres increased by 4 per cent. Larger farms and, to a less extent, fewer acres in farm land would account for this decrease in number of farms.

SIZE OF FARMS

| | Average farm area |
|------------|-------------------|
| 1900 | 88.5 |
| 1910 | 88.6 |
| 1920 | 91.6 |
| 1930 | 98.1 |

From 1910 to 1930 there was a tendency for the average size of Ohio farms to increase. The trend was especially noticeable in northwestern Ohio. In Paulding County, the average size of farm increased from 65 acres in 1900 to 131 acres in 1930. The county average ranged from 45 acres in Cuyahoga to 177 acres in Madison County. The adoption of larger units of machinery was a major factor in the trend towards larger farms.

Fig. 11.—Average size of farm—Acres, 1930

FARMS OPERATED BY TENANTS

| | Per cent |
|------------|----------|
| 1900 | 27.4 |
| 1910 | 28.4 |
| 1920 | 29.5 |
| 1930 | 26.3 |

In 1930, 26.3 per cent of Ohio farms was operated by tenants. The percentage varied from 12.2 per cent in Coshocton County to 52.1 per cent in Madison County. The higher per cent of tenancy was to be found in the higher land value section of the State. One-fourth of the tenants was cash tenants. Up to 1920 the percentage of tenancy in the State had been increasing, but from 1920 to 1930 there was a decrease.

SOME FARM CASH EXPENDITURES IN 1929

| | |
|--------------------------------|--------------|
| Implements and machinery | \$20,616,620 |
| Farm labor | 25,409,282 |
| Fertilizer | 11,028,050 |
| Feed | 32,603,845 |

The Census of 1930 reports the above items of farm expenditures for 1929. Northeastern Ohio counties reported the largest expenditures for fertilizer and, together with the counties around Cincinnati, the largest expenditure for feed.

CORN

| | Average area Acres | Average yield per acre Bu. |
|----------------|--------------------------|----------------------------------|
| 1900-1909..... | 3,898,000 | 36.56 |
| 1910-1919..... | 3,920,300 | 36.96 |
| 1920-1929..... | 3,605,300 | 37.25 |
| 1909..... | 4,080,000 | |
| 1919..... | 4,078,000 | |
| 1929..... | 3,473,143 | |

From 1910 to 1914 there was a tendency for the Ohio corn acreage to decrease. From 1914 to 1917 it again increased, reaching 4,200,000 acres in the latter year; this is probably the largest acreage ever grown in Ohio. After 1919 there was again a decrease in acreage until 1924; after this the acreage remained at about 12 per cent below the acreage of 1919 and 1920. The decrease in total corn acreage was general throughout the State but was especially noticeable in the eastern one-third of the State. In this area nearly every county showed a decrease of over 20 per cent; five counties showed a decrease of over 40 per cent. A comparison of the corn acreages grown for

grain in 1919 and 1929 shows that in the latter year the State acreage was 13 per cent less; whereas the eastern one-half of the State showed a decrease of 31 per cent in acreage. In 1919, 26 per cent of the corn grown for grain was grown in the eastern half of the State; in 1929, only 21 per cent. In the latter year 34 per cent of the crop land harvested in the State was in corn.

The area of corn put into the silo decreased from 224,469 acres in 1919 to 180,011 acres in 1929. This decrease was especially noticeable in the major corn-growing areas of western Ohio. In northeastern Ohio in 1919 and in 1929, several counties put over one-third of their total corn acreage into the silo.

Fig. 15.—Corn cut for silage—Acreage, 1929

Methods of corn harvest in the State vary widely. In 1927 Paulding County husked 76 per cent of its corn from the standing stalk. Pickaway County cut, shocked, and husked by hand 74 per cent of its corn area. Crawford County cut and shredded 37 per cent of its corn area. In Wood County 18 per cent was cut and fed in the shock; whereas in Marion County 18 per cent was hogged down.

During this period the yield per acre fluctuated widely, varying from 27 bushels in 1924, which was the lowest yield since 1893, to 46 bushels per acre in 1925, the highest yield on record for the State.

Fig. 16.—Corn—Average yield per acre, 1920-1929

WHEAT

| | Average harvested area Acres | Average yield per acre Bu. |
|----------------|------------------------------------|----------------------------------|
| 1900-1909..... | 2,162,800 | 14.60 |
| 1910-1919..... | 2,083,600 | 17.48 |
| 1920-1929..... | 1,787,100 | 16.50 |
| 1909..... | 1,827,932 | |
| 1919..... | 2,922,592 | |
| 1929..... | 1,563,740 | |

During the early part of this period the Ohio wheat area fluctuated around 2,000,000 acres. The years 1918 and 1919, however, saw a large expansion in the wheat area. In 1917 there were 2,050,000 acres harvested, in 1918 the acreage was 2,525,000, and in 1919 it was 2,861,000; thus did the Ohio farmer respond to the need for wheat and to the high prices received for it. The 1919 acreage was one of the largest ever grown in the State. After that year lower prices brought about a reduction in acreage. Since 1923 the acreage has never reached 2,000,000 and for the last few years of this period it has fluctuated around 1,600,000 acres. In 1929 the wheat acreage was 15.5 per cent of the crop land harvested in the State.

Fig. 17.—Wheat—Acreage, 1929

If one compares the areas of wheat at the beginning and end of the 20-year period, it is evident that the wheat area was shifting to the western half of the State. In 1909, for instance, 40.2 per cent of the total wheat area was in the eastern half of the State; in 1919, only 33 per cent. In northeastern Ohio, industrial expansion had curtailed the wheat acreage in many of the old "back-bone" counties (such as Summit, Portage, and Stark), which were outstanding early-wheat counties of the State. In southeastern Ohio the reduction in acreage which had been going on for several decades continued. Fifteen counties in the extreme southeast reported over 20 per cent of the total wheat area of the State in the Fifties, 9 per cent in the first decade of the present century, and less than 5 per cent in 1929. Lawrence County raised 3,000 acres of wheat in 1909 and 600 acres in 1929. There were several years of severe winter-killing during the period. In 1912 the abandonment was 45 per cent of the area seeded; in 1925 it was 30 per cent; and in 1928, 66 per cent. From 1910 to 1919 the average abandonment was 8.6 per cent; from 1920 to 1929 it was 15 per cent. A greater amount of winter-killing probably accounts for the lower yield of the latter period. The area seeded to spring wheat has never been very large. In 1919 there were 61,000 acres of spring wheat harvested, by 1921 this had decreased to 12,000 acres, and in 1929 it was 10,000 acres.

OATS

| | Average area Acres | Average yield per acre Bu. |
|----------------|--------------------------|----------------------------------|
| 1900-1909..... | 1,491,200 | 31.88 |
| 1910-1919..... | 1,685,200 | 36.40 |
| 1920-1929..... | 1,748,200 | 35.1 |
| 1909..... | 1,787,496 | |
| 1919..... | 1,452,052 | |
| 1929..... | 1,612,758 | |

From 1910 to 1930 there was a slight increase in the oat acreage. Years of partial wheat failure, such as 1912 and 1928, were the years of highest oat acreage, in the latter year reaching 2,374,000 acres. From 1918 to 1924 there was some reduction in the oat acreage due to the large area in wheat, but since the latter date the acreage lost has been regained. As with corn, a larger portion of the total oat acreage was found in the western half of the State in 1929 than in 1919. In the former year, 32 per cent of the total oat acreage was in the eastern half of the State; in the latter year, 26.3 per cent. In 1929 the oat acreage comprised nearly 16 per cent of the crop land harvested in the State.

Fig. 19.—Oats—Acreage for grain, 1929

In many of the southeastern and Ohio River counties where few oats are grown, a considerable portion of the oat acreage is cut and fed unthreshed; whereas in other counties of this area, such as Vinton, a larger area of the oats is cut for hay than is threshed.

The period saw a noticeable increase in the yield per acre. During the 10 years from 1910 to 1919, 4 years had yields of over 40 bushels per acre and one year a yield below 30 bushels. During the 10 years from 1920 to 1929, 4 years had yields of over 40 bushels per acre and 3 years yields below 30 bushels. These 3 years of low yields reduced the 10-year average yield below that of 1910 to 1919.

BARLEY

| | Average area Acres | Average yield per acre Bu. |
|----------------|--------------------------|----------------------------------|
| 1900-1909..... | 38,900 | 27.03 |
| 1910-1919..... | 51,400 | 28.20 |
| 1920-1929..... | 115,400 | 25.7 |
| 1909..... | 24,075 | |
| 1919..... | 114,217 | |
| 1929..... | 86,120 | |

Fifty per cent of the barley area in the State in 1929 was to be found in 10 northwestern Ohio counties. The yearly area fluctuated widely, due to the substitution of barley for wheat in case the latter winter-killed. In 1928, the year of much winter-killing of wheat, the barley area reached 318,000 acres.

Fig. 21.—Barley—Acreage, 1929

RYE

| | Average area Acres | Average yield per acre Bu. |
|----------------|--------------------------|----------------------------------|
| 1900-1909..... | 67,300 | 16.7 |
| 1910-1919..... | 108,800 | 16.4 |
| 1920-1929..... | 56,600 | 12.5 |
| 1909..... | 67,912 | |
| 1919..... | 116,464 | |
| 1929..... | 50,465 | |

In 1929, only 12 Ohio counties raised over 1,000 acres of rye which was threshed for grain. There has been little change in the rye area of the State in the past 70 years.

BUCKWHEAT

| | Average area Acres | Average yield per acre Bu. |
|----------------|--------------------------|----------------------------------|
| 1900-1909..... | 10,900 | 17.2 |
| 1910-1919..... | 20,800 | 19.8 |
| 1920-1929..... | 28,800 | 18.4 |
| 1909..... | 26,073 | |
| 1919..... | 30,413 | |
| 1929..... | 32,340 | |

Buckwheat is a minor crop in Ohio. Ashtabula County usually grows one-fourth of the total area for the State. Here, land which is prepared too late for corn or oats is frequently sown to buckwheat.

HAY (All Hay)

| | Average area Acres | Average yield per acre Tons |
|----------------|--------------------------|-----------------------------------|
| 1900-1909..... | 2,812,300 | |
| 1910-1919..... | 2,981,800 | |
| 1920-1929..... | 3,019,300 | 1.15 |
| 1909..... | 3,176,423 | |
| 1919..... | 3,026,527 | |
| 1929..... | 2,625,351 | |

Fig. 24.—All hay—Acreage, 1929

The hay acreage of the State is exceeded only by that of corn. In 1929 the hay acreage was 26 per cent of the total crop land harvested in the State. From 1924 to 1930 there was a noticeable tendency for the acreage in hay to decrease; this was especially true in the eastern counties where hay comprises a relatively large percentage of the crop acreage. Of the 1929 hay acreage, about 1,900,000 acres were reported to be clover and timothy mixed, 380,000 acres red, alsike, and mammoth clover, and the remainder mostly other legumes. Due to the change in method of reporting, comparable statistics on hay yield are not available over the 20-year period.

Fig. 25.—Hay—Average yield per acre, 1920-1929

ALFALFA

| | Acreage |
|------------|---------|
| 1909 | 29,439 |
| 1919 | 94,418 |
| 1929 | 190,261 |

At the beginning of this period, alfalfa growing in Ohio was only emerging from the experimental stage; since then there has been a steady increase in acreage. In 1929 alfalfa comprised 7 per cent of the total hay area of the State. In 1909 its production was localized, only six counties reporting over 1,000 acres. In 1919 over 1,000 acres were grown by each of 28 counties and in 1929, by 43 counties. With the exception of three, these counties are all in the limestone area of the western half of the State. In 1909 the alfalfa area of Lucas, Wood, and Ottawa Counties was 2 per cent of the total hay area; in 1929 it was 49 per cent.

Fig. 26.—Alfalfa—Acreage, 1929

SWEET CLOVER (For Pasture)

192976,482 acres

Sweet clover is another legume which has found its way into the Ohio field system since 1910. In addition to the acreage used for pasture in 1929, a smaller acreage was cut for hay. Data as to this latter area are not available, but the 1929 Census reports a total of 36,522 acres of sweet, crimson, and Japan clover cut for hay; this was largely sweet clover.

Fig. 27.—Sweet clover for pasture—Acreage, 1929

CLOVER SEED

1929283,012 acres

Ohio leads the nation in the production of clover seed. Over one-half of the total production for the State is in the northwestern quarter of the State. The clover threshed for seed is mostly red and alsike.

Fig. 28.—Clover seed—All kinds—Acreage, 1929

SOYBEANS

192986,642 acres (grown alone)

The soybean acreage has been increasing in Ohio since 1910. The acreage given above is that reported by the Census of 1929 as the total acreage grown alone for hay or seed. Twenty-nine counties reported over 1,000 acres. In addition to this, many soybeans were sown with corn. The soybean acreage was nearly one-half that of alfalfa.

Fig. 29.—Soybeans—Grown alone—Acreage, 1929

TOBACCO

| | Average area Acres | Average yield per acre Pounds |
|----------------|--------------------------|-------------------------------------|
| 1900-1909..... | 66,440 | 865 |
| 1910-1919..... | 92,580 | 885 |
| 1920-1929..... | 46,500 | 897 |
| 1909..... | 106,477 | |
| 1919..... | 75,789 | |
| 1929..... | 49,575 | |

The tobacco acreage in Ohio reached its maximum from 1909 to 1918. From the latter date to 1927 the acreage declined over 60 per cent. Since 1927 the acreage has again increased. In comparing the acreage of 1909 with that of 1929, one finds the area in the eastern district to have decreased 70 per cent, that of the Miami Valley 56 per cent, and that of the Burley Tobacco district 36 per cent.

Fig. 30.—Tobacco—Acreage, 1929

SUGAR BEETS

| | Average area Acres | Average yield per acre Tons |
|----------------|--------------------------|-----------------------------------|
| 1920-1929..... | 37,100 | 8.6 |
| 1909..... | 7,036 | |
| 1919..... | 33,591 | |
| 1929..... | 17,693 | |

The production of sugar beets in Ohio began soon after 1910; the acreage gradually increased until there were approximately 50,000 acres in 1924, from which time the acreage decreased. In 1924 there were 4,148 farmers in the State growing sugar beets. Production is concentrated in the northwest corner of the State. There were five sugar beet factories in the State in 1929.

Fig. 31.—Sugar beets—Acreage, 1929

POTATOES

| | Average area Acres | Average yield per acre Bu. |
|----------------|--------------------------|----------------------------------|
| 1900-1909..... | 170,400 | 92.4 |
| 1910-1919..... | 163,400 | 78.6 |
| 1920-1929..... | 109,400 | 91.5 |
| 1899..... | 167,590 | |
| 1909..... | 212,808 | |
| 1919..... | 124,917 | |
| 1929..... | 104,490 | |

About 1910 Ohio's potato acreage reached its maximum; from that date until 1924 the acreage decreased, reaching 102,000 acres in the latter year. After 1924 there was a tendency for the acreage to increase again. In 1909, 33 per cent of the total potato acreage of the State was found in 12 northeastern counties; in 1929, 27 per cent of the total acreage was in the same 12 counties. Wayne County, which, in 1929, had the largest potato acreage of any county in the State, increased its acreage approximately 60 per cent during the period 1920 to 1930.

Fig. 32.—Potatoes—Acreage, 1929

From 1925 to 1930 there was a renewed interest in potato growing in the State. This interest was not fully reflected in the increase in acreage, because, although many had begun to grow potatoes on a commercial scale, others had ceased to grow any potatoes. Twelve counties reported larger potato acreage in 1929 than in 1919. These were mostly northern Ohio counties. Local markets, good roads, and motor trucks had nearly eliminated car-lot shipments of potatoes from Ohio.

A succession of poor yields from 1910 to 1920 greatly reduced the 10-year average yield. From 1900 to 1909 the average yield for the State was 92.4 bushels, from 1910 to 1919 it fell to 78.6 bushels, and from 1920 to 1929 it rose again to 91.5 bushels. In the 7 years centering around 1921 the average yield was 80 bushels and in the 7 years centering around 1928 it was 97 bushels.

Fig. 33.—Potatoes—Average yield per acre, 1920-1929

VEGETABLES (Harvested for Sale)

(Not including potatoes)

| | Acres | Value |
|-----------|--------|--------------|
| 1929..... | 93,790 | \$10,749,593 |

Of the out-door-grown vegetables harvested for sale in Ohio in 1929, over one-half of the total value was produced in 13 counties adjacent to the larger cities. Twenty-five per cent of the total was produced in the four counties Lucas, Hamilton, Cuyahoga, and Franklin. Tomatoes (14,290 acres), sweet corn (37,562 acres), celery (2,353 acres), cabbage (6,866 acres), and onions (6,602 acres) comprised 61 per cent of the commercial vegetable acreage grown in the State and 63 per cent of the value. In addition to the area adjacent to larger cities, other vegetable-growing regions had developed. Notable among these was Washington County, which specialized in early tomatoes, cabbage, and sweet corn and shipped mostly to the Pittsburgh market. Since 1920 Meigs County has expanded its vegetable area along the Ohio River.

Hardin County was noted for its onions (dry); Portage, Stark, and Summit Counties for celery. These latter two crops were grown in the marshes along the divide between Lake Erie and the Ohio River. Sandusky County was noted for its cabbage and sauerkraut factories. Erie, Mercer, and Henry Counties also grew large cabbage acreages. Centering around Pickaway and Warren Counties were well established sweet corn canning areas, Pickaway County alone growing over 4,000 acres of sweet corn in 1929. Pickaway County also led the State in the acreage of peas grown for canning. Wood County in the northwest grew over 3,000 acres of tomatoes for canning in 1929.

Fig. 34.—Vegetables harvested for sale—Value, 1929

NURSERY PRODUCTS

TREES, PLANTS, VINES, FLOWER AND VEGETABLE SEEDS, BULBS, ETC.

| | (Value of sales in 1929) | |
|-----------|--------------------------|----------------|
| | No. of farms | Value of sales |
| 1929..... | 921 | \$3,435,809 |

Lake County has long been noted for its large area in nursery crops. Of more recent development is the area around Columbus, Springfield, Dayton, and Cincinnati.

Fig. 36.—Trees, plants, vines, flower and vegetable seeds, bulbs, etc.—Value, 1929

APPLES

| | Trees of bearing age | Trees not of bearing age | All trees |
|-----------|-------------------------|-----------------------------|-----------|
| | No. | No. | No. |
| 1910..... | | | 8,505,000 |
| 1920..... | 5,970,000 | 2,048,000 | 8,018,000 |
| 1930..... | 4,661,000 | 1,939,000 | 6,600,000 |

In 1900 there were reported to be over 12,000,000 apple trees in Ohio. The decline in numbers since that date has been due to the gradual disappearance of the farm orchard because of lack of care. At the time of the 1930 Census, 127,136 farms reported apple trees; this would indicate that nearly 60 per cent of the farms in the State had apple trees.

Fig. 37.—Number of apple trees of bearing age, 1930

Of the total number of trees, 39 per cent was in the western half of the State in 1909. Of the bearing trees, 37 per cent was in the western half in 1920; in 1930, the percentage was 32. Of the non-bearing trees, 27 per cent was in the western half of the State in 1920, and 30 per cent in 1930. From 1910 to 1919 the extreme southeastern Ohio counties were expanding their orchards more rapidly than any other section. In 1920, Lawrence and Gallia Counties reported 18 per cent of all the apple trees of non-bearing age in the State. From 1920 to 1929 the expansion was less rapid in the southeastern counties. In 1930 Lawrence and Gallia Counties reported only 8.5 per cent of the trees of non-bearing age. During the latter decade the lake shore counties and northeastern Ohio increased their rate of planting, as did a group of counties in southwestern Ohio around Dayton. The average total apple production for the State from 1910 to 1919 was 9,000,000 bushels; from 1920 to 1929, it was 7,600,000 bushels. During the entire period the yearly production varied from 3,000,000 bushels to 18,000,000 bushels. Of the total crop from 1926 to 1930, over 27 per cent was classed as commercial production.

Fig. 39.—Number of peach trees of bearing age, 1930

Ottawa County still led the State in number of peach trees in 1930, although the number had decreased one-third since 1910. During the 20-year period northeastern Ohio increased its number of peach trees. In southeastern Ohio the number increased from 1910 to 1920 but decreased from the latter date to 1930. In 1930 northeast Ohio had a higher percentage of the young peach trees than it had in 1920. From 1911 to 1919, the production averaged 1,180,000 bushels; from 1920 to 1929, it was 1,412,000 bushels.

Fig. 40.—Number of peach trees not of bearing age, 1930

GRAPES

| | Bearing age No. | Not of bearing age No. | Total No. |

| Blueberries | | | 15 |
| Cranberries | | | 1 |

Aside from apples, peaches, and grapes, the area in small fruit in Ohio was comparatively small in 1930. Only two counties—Sandusky and Stark—reported over 15,000 bearing cherry trees in 1929. Commercial pear production was found largely along the lake and around Cincinnati. Ottawa and Stark were the only two counties in the State reporting over 10,000 bearing plum trees in 1929; the number of trees was decreasing.

Small fruits were also a minor enterprise in Ohio. Lawrence, Scioto, and Fairfield Counties were among those having the larger acreage. The others were mostly along the lake. Lawrence County, with 353 acres in 1929, led the State in strawberry acreage.

MAPLE SYRUP

During the 10 years from 1920 to 1929, the annual production of the State was around 500,000 gallons of maple syrup and 50,000 pounds of maple sugar. This was a considerable decrease from earlier years. Geauga County alone, in 1929, produced over one-third of the State total, in spite of the fact that many maple trees have been cut in recent years.

Fig. 43.—Maple syrup—Gallons, 1929

ALL CATTLE

| | Census Adjusted to January 1 No. |
|------------|--|
| 1910 | 1,687,000 |
| 1920 | 1,927,000 |
| 1930 | 1,610,000 |

The total number of cattle of all ages in the State increased from 1910 to 1920; after the latter date there was some decrease. The Census of 1920, as of January 1, reported for the State 1,349,373 dairy cattle of all ages and 577,450 beef cattle of all ages. Of the decrease in the number of cattle from 1920 to 1930 probably one-half was in beef cattle. The beef cattle enterprise in Ohio is of two types. That of southeastern Ohio is based upon the large proportion of land in permanent pasture. Young stock is raised, and some of it is sold to be fattened in the corn belt, some is sold as grass cattle, and some fed out in those areas which have the available corn. In western Ohio, the two leading beef cattle feeding areas are in Madison, Fayette, Pickaway, and

Fig. 45.—Steers, bulls, cows, and heifers kept for beef production, 1930

DAIRY INDUSTRY

| | Census adjusted to January 1 Cows and heifers kept for milk | All dairy cattle |
|-----------|---|---------------------|
| | No. | No. |
| 1910..... | 835,000 | |
| 1920..... | 918,000 | 1,349,373 |
| 1930..... | 900,000 | |

Milk production in Ohio increased from 308,000,000 gallons in 1909 to 348,000,000 gallons in 1919 and to 454,000,000 gallons in 1929. Differences in the dates of enumeration and differences in the Census definition of milk cows make difficult a comparison of changes in the number of dairy cows. The figures given, however, are the best estimates which have been arrived at. From 1909 to 1919, all sections of the State, with the possible exception of southeastern Ohio, showed an increase in the number of milk cows. Two-thirds of the total increase in number of cows, however, occurred in the first three rows of counties south of the lake. This increase continued up to 1924 when there was reported to be a total of 964,000 milk cows in the State. From the latter date to 1929 there was a decline in number; after 1929 the number again increased.

Fig. 47.—Dairy cows—Number, 1930

Although the total number of milk cows in the State shows a decrease when 1929 is compared with 1919, this decrease in number was confined to northeastern Ohio and to the counties around Cincinnati in the southwest. Cuyahoga, Geauga, and Lake Counties alone showed a total decrease sufficient to account for the State decrease. In these northeastern counties the expansion of the urban area and the tendency for some of the poorer areas to go out of use led many to abandon the dairy industry. Others switched from dairying to poultry. From 1920 to 1930, 10 counties in this area showed a total decrease of 44,000 milk cows, or a 22 per cent decrease in number. In other areas of the State dairying increased, especially in the central and west central and southeastern Ohio counties.

The 50 per cent increase in milk production during this period was due both to more cows and to a higher production per cow. This higher production per cow was due to better feeding and management and to the fact that a larger proportion of the cows listed as milk cows were of the dairy type in 1930 than in 1910. The average milk production per cow milked in 1929 was 5,332 pounds; on the basis of per cow and heifer 2 years old or over on farms January 1, 1930, it was 5,045.

Fig. 48.—Dairy products sold (Butter, cream, and wholemilk)—Value, 1929

The first record of bovine tuberculosis testing in Ohio is in the year 1902. Testing work was started at that time in a very small way and continued to the year 1917. In the latter year the State initiated its cooperative arrangement with the Federal Department, and the Federal Government began paying indemnity. In the fall of 1922 the area plan of testing was started in Lyme Township, Huron County. The area test for Ohio was completed December 26, 1931, and Ohio was accredited January 1, 1932.

Of the total milk produced in the State in 1909, about 32 per cent was sold as whole milk, in 1919 it was 40 per cent, and in 1929 it was 50 per cent. Whole milk sales, therefore, more than doubled during the period; this largely represents an increase in the sale of market milk, as comparatively little milk in the State is sold to creameries, cheese factories, or to milk-product manufacturing plants. There are a few condenseries in northwestern Ohio, but these consume probably not over 5 per cent of the total milk produced in the State.

Fig. 49.—Cream sold as butterfat—Pounds, 1929

In the territory more distant from a city market or transportation, butterfat sales increased. By 1919 little milk was brought into creameries for the purpose of butter production; it was largely sent from the farm as cream. Butterfat sales from the farm mounted from 14,000,000 pounds in 1909 to 50,000,000 in 1919. In 1929 it was 47,000,000 pounds. Creamery butter manufactured in the State averaged around 80,000,000 pounds annually from 1920 to 1930.

In 1909, there were 63,569,000 pounds of butter made on Ohio farms; in 1929, there were 14,500,000 pounds. The amount of farm butter sold was 39,252,000 pounds in 1909 and 6,038,000 pounds in 1929. In 1930, there were produced in Ohio 1,000,000 pounds of American cheese and 914,000 pounds of Swiss cheese; this latter cheese was largely produced in Tuscarawas and adjoining counties.

Fig. 50.—Whole milk sold—Gallons, 1929

HOGS

Census
Adjusted to January 1

| | No. |
|------------|-----------|
| 1910 | 2,349,000 |
| 1920 | 3,084,000 |
| 1930 | 2,078,000 |

The data available show a gradual increase in the number of hogs on Ohio farms from 1910 to 1917. From 1917 to 1920 there was a rapid increase; during the latter year more hogs were reported in the State than ever before or since. From 1920 to 1930 the numbers decreased. A comparison of 1930 with 1910 shows a decrease of 11 per cent in the total number of hogs on farms on January 1, in the State. In the eastern half of the State the decrease was 35 per cent. This large decrease in the eastern part would largely account for the decrease in numbers for the State as a whole. The number of hogs on farms January 1, however, does not give a true indication of the trend of the hog industry in the State, due to the well known fact that hogs are now marketed at an earlier age than in former years. It is estimated that, during the last 5 years of the period, the pounds of hogs sold exceeded those of the first 5 years by about 15 per cent.

Fig. 51.—Hogs—Number, 1930

SHEEP

Census
Adjusted to January 1

| | No. |
|------------|-----------|
| 1910 | 3,199,000 |
| 1920 | 2,103,000 |
| 1930 | 2,105,000 |

From 1910 to about 1922 the number of sheep in Ohio was decreasing. Since the latter date there has been some slight increase. The decrease in number of sheep seems to have been quite general, being fully as great in the counties with a large sheep population as in the others. The five counties Knox, Licking, Harrison, Muskingum, and Coshocton each had over 100,000 head of sheep in 1930. Eastern Ohio is still an outstanding, fine-wool-producing area; of recent years, however, more attention is being given to the lamb crop and a smaller percentage of wethers is kept in the flock. The wool clip of 1919 was 14,139,000 pounds; that of 1929, 14,657,000 pounds.

Fig. 52.—Sheep—Number, 1930

POULTRY

Eggs produced

Doz.

| | |
|------|-------------|
| 1909 | 96,259,005 |
| 1919 | 102,377,143 |
| 1929 | 135,990,334 |

As indicated by the number of eggs produced, the poultry enterprise has been expanding in Ohio during the 20-year period. A large part of this expansion has been due to an increase in the number of eggs laid per hen per year. The Census figures on numbers of hens for the three periods are not comparable, due to differences in the date of taking the Census and in methods of inquiry. The Census of 1930, taken as of April 1, reports 17,999,945 chickens over 3 months old. In 1929 the value of chickens and eggs sold was given as \$50,818,520.

A notable change during the period has been the development of the commercial hatchery business. In 1929 the number of baby chicks bought was 63 per cent of the chickens raised.

Fig. 53.—Chicken eggs produced—Dozens, 1929

STATISTICS

The statistical data as printed in the appendix are derived from Federal and State sources. Those taken from the Census are given as reported in the Census volumes, with the exception of the number of head of livestock. The United States Census of 1910 was taken as of April 15, that of 1920 as of January 1, and that of 1930 as of April 1. The 1910 and 1930 figures for livestock were adjusted to a January 1 basis, and the adjusted figures are the ones used in this bulletin. The 10-year averages for the number of head of livestock as given in the appendix are the numbers reported for taxation as given by the State Auditor. It will be noted that numbers reported here for the 10-year period 1900-1909 differ from those given in Bulletin 326. The latter figures seem to have been in error.

The 10-year average figures for crop acreage, yield, and production need some explanation. Up to 1924 the tax blanks sent to farmers contained a page upon which they reported the crop acreage and production for the previous year. In 1924 this page was discontinued, and the data were therefore no longer available. This broke the series which dates back to 1850. It was the first intention to publish in this bulletin the data from 1900 to 1919 as reported on the assessor's blank so that the data would be comparable with those published in Bulletin 326 for the period from 1850 to 1909. This, however, would not have made the data as published for 1900-1909 and 1910-1919 comparable with those for 1920-1929. The 1920 to 1929 figures are of necessity based on the crop report figures. Those for 1920 to 1929 are as reported by the Crop Reporting Service; those for 1900-1909 and 1910-1919 are the assessor's figures adjusted so as to make them comparable with those for 1920-1929. The data as published herein for the period 1900-1909, therefore, differ from those published in Bulletin 326. The assessor's figures on crop acreage have always been lower than those reported by the Census or the crop reporters. The assessor's figures for 1900 to 1919 on crop acreage and production were increased as follows: Corn, 25 per cent; wheat and oats, 11.1 per cent; hay, 15 per cent; potatoes, 35 per cent; and tobacco, 60 per cent.

Some inconsistencies in the data might be pointed out. The change in source of data after 1920 may raise some question as to the strict comparability with the data of earlier years. The hay yields as given for 1900 to 1919 are as reported by the assessors; those for 1920-1929 are the crop reporters. The assessor's figures were doubtless low since they frequently reported the total acres in grass and the tons of hay cut and from these the yield was computed. Since pastured grass was frequently included in the area, the resulting yield-per-acre figure up to 1920 was low. With the exception of hay, however, the yield-per-acre figures would appear to be comparable for the three periods. The corn acreage as reported from the Census and the 10-year average represent total corn, including silage. The 10-year average production figure for corn was computed by multiplying the total corn acreage by the yield per acre of field corn; it, therefore, includes a field corn equivalent of the silage.
